Minutes
PESC TAB Meeting
5/20/2011

Attendees
Jam Hamidi
Steve Margenau
Sue Lou
Michael Morris

Discussion:
1. Steve explained how he had modified core main to accommodate a language attribute. He discovered a problem when trying to add the attribute to simple types: Restrictions of the changed type (which is now a complex type with simple content) would not validate. Steve will experiment some more and report back next week.
2. We discussed the SIF web service approach and determined it was too complex for a simple transport. For interoperability, Jam suggested that we could define a subset so that PESC could be interoperable (but perhaps not certifiably compliant) with the SIF infrastructure. Michael suggested that SIFA could allow PSEC message standards to be considered objects in the SIF framework.
3. Jam indicated that he is revising the DTS standard to include an updated web service model. He is looking for a word version of the DTS.
4. Sue indicated that review of the XML R&R was still in progress, and she did not know when the review would be finished. The analyst doing the work is doing it as a side project.
5. We adjourned at 3:00

Actions:
1. Steve will continue his example implementation of the language attribute and try to resolve the restriction issue he discovered
2. Jam will continue developing the DTS standard.
3. Michael will try to see if he can find a DTS version in Word for Jam.
4. Michael will discuss the SIF interoperability issues at the XML Architecture group.
